Year - 2026

ACKNOWLEDGEMENT

We would like to take this opportunity to express our deep sense of gratitude to all individuals who helped us directly or indirectly during this project work.

Firstly, we would like to thank our supervisor, Uma Maheshwari, for being a great mentor and the best adviser we could have asked for. Their advice, encouragement, and constructive feedback served as a source of innovative ideas and inspiration, and were central to the successful completion of this project. The confidence shown in us was the biggest source of motivation throughout this journey.

We extend our sincere thanks to the Edunet Foundation, Microsoft, LinkedIn, and SAP for providing this fellowship opportunity, the learning resources, and the platform to develop and showcase our AI skills.

We are also grateful to our institution, Smt. Maniben M P Shah Women's College of Arts and Commerce, for providing the necessary infrastructure and support throughout the project duration.

Finally, we thank our family and friends for their continuous encouragement and support.

Note: *This Acknowledgement should be written by students in their own words. Do not copy and paste.*

ABSTRACT OF THE PROJECT

This project – Smart Content Creation and Digital Marketing using AI Tools – is submitted as part of the AICW (Artificial Intelligence in the Contemporary World) Fellowship Program 2026, a collaborative initiative by Edunet Foundation in partnership with Microsoft, LinkedIn, and SAP.

The project focuses on analyzing digital marketing performance and chatbot interaction data to understand user behavior, engagement patterns, and content effectiveness. The dataset consists of records related to user interactions such as clicks, responses, content type, and campaign performance. It provides insights into how users engage with chatbot-based communication systems across digital platforms. Tools such as Microsoft Excel and Power BI are used along with AI assistance to perform data analysis and visualization.

Data cleaning and preprocessing were carried out to handle missing values, remove duplicate records, and standardize data formats to ensure accuracy and consistency. Key metrics such as user engagement rate, response rate, and content performance indicators were analyzed using pivot tables and dashboards. AI tools, including chatbot systems, were applied using structured prompts to generate content, summaries, and insights based on the dataset.

Key findings indicate that personalized chatbot responses and targeted content significantly improve user engagement and interaction rates. AI-generated content helps in reducing manual effort while increasing efficiency and consistency in digital marketing strategies. Chatbot-based communication was found to enhance customer experience by providing faster and more relevant responses.

An interactive dashboard was developed to present key insights visually, enabling better decision-making. The project demonstrates how integrating AI tools with data analytics can optimize content creation, improve marketing effectiveness, and support data-driven strategies. The final output includes a cleaned dataset, analytical report, AI-generated content samples, and a complete project repository with documentation and demonstration.

CHAPTER 1

Introduction

This chapter introduces the project undertaken as part of the AICW Fellowship Program. It outlines the background, the problem being addressed, the motivation behind this work, and the objectives and scope of the project. The fellowship projects span multiple domains including Data Analytics, Business Intelligence, Healthcare Analytics, Content Generation, and AI-assisted Reporting.

1.1 Problem Statement

The core problem addressed in this project is the inefficient utilization of digital marketing and chatbot interaction data for effective content creation, personalization, and customer engagement in modern business environments.

Main Problem / Challenge:

In today's digital ecosystem, organizations generate massive volumes of data through websites, social media platforms, and chatbot interactions. This data includes user queries, engagement metrics, content performance, and behavioral patterns. However, much of this data remains unstructured, inconsistent, or poorly analyzed. As a result, businesses struggle to extract meaningful insights and fail to create targeted, relevant, and engaging content for their audience.

Real-World Significance:

This problem is highly significant in the real world because digital marketing has become a key driver of business growth and customer acquisition. Ineffective content, delayed responses, and lack of personalization can lead to poor customer experience, reduced engagement, and loss of potential customers. In competitive markets, businesses that fail to use data-driven and AI-powered strategies risk falling behind competitors who leverage smart technologies for marketing optimization.

Who is Affected:

This issue impacts multiple stakeholders. Businesses face challenges in improving marketing performance and return on investment (ROI). Digital marketers struggle to design effective campaigns due to lack of actionable insights. Customers are also affected, as they often receive generic, irrelevant, or delayed responses from chatbot systems, leading to dissatisfaction and reduced trust.

Limitations of Existing Approaches:

Traditional digital marketing approaches rely heavily on manual data analysis and static content strategies, which are time-consuming and less efficient. Many existing chatbot systems are rule-based and lack the ability to learn from data or provide personalized responses. These approaches do not fully utilize the potential of Artificial Intelligence and fail to integrate data analytics with content creation, resulting in missed opportunities for optimization.

Gap and Project Focus:

There is a clear gap in integrating AI tools with chatbot data to enable intelligent, automated, and personalized content creation. This project aims to bridge this gap by applying data analysis techniques and AI tools to transform raw marketing data into actionable insights and smart content strategies. It focuses on improving chatbot interactions, enhancing user engagement, and optimizing digital marketing performance through AI-driven solutions.

1.2 Motivation

The motivation behind this project is to explore how AI tools and data analytics can improve digital marketing and chatbot communication.

- This project is personally and professionally meaningful as it provides hands-on experience with AI tools, data analysis, and real-world applications in marketing.
- It has strong real-world relevance as businesses increasingly depend on digital platforms and AI-driven solutions.
- The project can help organizations improve customer engagement, automate responses, and enhance content quality.
- It aligns with modern industry trends in Artificial Intelligence, Data Analytics, and Business Intelligence, where AI-powered chatbots and smart content strategies are widely used.

1.3 Objectives

Clearly state the objectives of your project. Objectives should be measurable and specific.

1. To collect and understand the structure of the dataset related to digital marketing and chatbot interactions.

2. To clean and preprocess raw data by removing duplicates, handling missing values, and correcting inconsistencies.
3. To analyze user behavior, engagement patterns, and content performance using Excel, Power BI, and AI tools.
4. To build interactive dashboards or reports that clearly present key insights and trends.
5. To integrate AI tools (such as chatbots or Copilot) to automate content creation and enhance marketing strategies.
6. To develop smart and personalized chatbot responses based on data-driven insights to improve user engagement.

1.4 Scope of the Project

Define the boundaries and limitations of the project clearly.

- This project covers data related to digital marketing performance and chatbot user interactions, including engagement metrics, content types, and response patterns.
- The tools used are limited to Microsoft Excel, Power BI, and AI tools such as chatbots or Copilot as part of the fellowship program.
- The analysis focuses on data cleaning, visualization, and AI-based content generation rather than advanced predictive modeling.
- The project demonstrates the use of AI in improving content creation and marketing strategies but does not include real-time deployment of chatbot systems.
- This project is intended as an academic and practical learning exercise and not as a full-scale commercial implementation.

CHAPTER 2

Literature Survey

A literature survey reviews existing research, tools, and methodologies relevant to the project domain. It helps identify gaps that the current project aims to address.

2.1 Existing Work and Research

In recent years, digital marketing has evolved significantly with the integration of Artificial Intelligence (AI). Many studies highlight how AI-driven tools help in analyzing customer behavior, predicting trends, and improving marketing strategies. Businesses use data analytics to track user engagement, clicks, impressions, and conversion rates to make better decisions.

Chatbots have become a widely used technology in customer service and digital marketing. Existing chatbot systems range from rule-based bots to AI-powered conversational agents that provide automated responses. Research shows that chatbots can improve customer interaction, reduce response time, and enhance user experience.

Various tools and techniques such as Microsoft Excel, Power BI dashboards, and AI prompt engineering frameworks are commonly used for data cleaning, visualization, and content generation. AI tools like chatbots and content generators are used to create marketing content, summaries, and personalized responses based on user data.

However, despite these advancements, many existing solutions lack proper integration between data analytics and AI-based content creation. Most systems either focus only on data analysis or only on chatbot automation, without combining both for better marketing outcomes.

2.2 Tools and Technologies Review

Briefly review the tools and technologies used in your project:

Microsoft Excel:

In this project, Microsoft Excel is used as the primary tool for data cleaning, preprocessing, and analysis. The dataset related to digital marketing and chatbot interactions is organized and structured using Excel. Techniques such as removing duplicates, handling missing values, and standardizing data formats are applied to improve data quality. Excel features like pivot tables, conditional formatting, and formulas (SUMIF, COUNTIF, IF, VLOOKUP) are used to analyze user engagement, content performance, and interaction patterns. This helps in extracting meaningful insights from the raw dataset.

AI Chatbot (e.g., ChatGPT):

In this project, an AI chatbot is used to generate smart content, automated responses, and marketing-related outputs. The chatbot helps in creating personalized content based on user behavior and dataset insights. It is also used to generate summaries, chatbot conversation scripts, and marketing messages. By using natural language prompts, the chatbot enhances content creation and improves the effectiveness of digital marketing strategies.

Microsoft Copilot (AI):

Microsoft Copilot is used in this project as an AI assistant to support data analysis and content generation. It helps in generating insights, summarizing data, and assisting in report writing using simple prompts. Copilot improves efficiency by automating repetitive tasks and simplifying complex data interpretation. It is also used to enhance productivity and ensure that the analysis and content generation process is faster and more accurate.

2.3 Gaps Identified

Gap 1 - Complexity of Existing Methods: Most existing studies focus on advanced machine learning techniques, which are difficult for students and non-technical users to understand and implement. In this project, this gap is addressed by using simple and practical tools like Microsoft Excel and AI chatbots, making the solution easy to use and apply.

Gap 2 - Lack of Integration Between Data Analysis and AI: Many existing systems either focus only on data analysis or only on content generation, without connecting both processes. This project overcomes this limitation by integrating data analysis (using Excel) with AI tools (chatbot and Copilot) to generate meaningful, data-driven content and insights.

Gap 3 - Limited Personalization in Chatbots: Traditional chatbot systems are mostly rule-based and provide generic responses, which reduces user engagement. In this project, AI-powered chatbots are used to generate personalized and relevant content based on user interaction data, improving communication quality.

Gap 4 - Unstructured Use of AI Prompts: Existing approaches often do not use properly structured prompts, leading to inconsistent AI outputs. This project addresses this issue by designing and using clear, well-defined prompts to generate accurate insights, summaries, and marketing content.

Gap 5 - Incomplete End-to-End Workflow: Many solutions do not cover the complete process from raw data to final output. In this project, a complete workflow is followed, including data cleaning, preprocessing, analysis, visualization, and AI-based content generation, making it a comprehensive solution.

CHAPTER 3

Proposed Methodology

This chapter describes the methodology adopted to achieve the project objectives. It covers the system design, modules used, data flow, advantages, and requirement specifications.

3.1 System Design

The overall design of the project follows a structured workflow from raw chatbot and marketing data to actionable insights and AI-driven content creation.

Phase 1 - Data Source / Input: The dataset includes 500 records AI Digital Marketing dataset explored. All 17 fields mapped: Campaign, Platform, Content_Type, AI_Tool_Used, Post_Date, Audience_Age_Group, Target_Gender, Region, Ad_Spend_USD, Impressions, Clicks, Click_Through_Rate, Conversions, Conversion_Rate, Engagement_Rate, Content_Sentiment, ROI.

Phase 2 - Data Cleaning: Preprocessing involves removing duplicates, handling missing values, correcting inconsistent formats (e.g., dates, text categories), and standardizing fields. Excel tools like *Remove Duplicates*, *IFERROR*, and *Power Query* are used.

Phase 3 - Analysis / Processing: Analytical techniques include pivot tables, formulas (SUMIF, COUNTIF, VLOOKUP), and Power BI dashboards to identify user behavior patterns, content performance, and campaign effectiveness.

Phase 4 - AI Integration: AI chatbots (Copilot, ChatGPT, Gemini) are used to generate personalized responses, marketing content, and summaries based on dataset insights. Prompt engineering ensures optimized outputs.

Phase 5 - Visualization / Output: Interactive dashboards in Power BI present KPIs such as engagement rate, conversion rate, and content effectiveness. AI-generated chatbot scripts and marketing content are documented as outputs.

3.2 Modules / Components Used

The project is divided into functional modules:

Module 1 - Data Ingestion: Loading chatbot and marketing datasets into Excel/Power BI.

Module 2 - Data Cleaning & Preprocessing: Removing inconsistencies, duplicates, and null values; standardizing formats.

Module 3 - Data Analysis: Using Excel formulas and Power BI measures to identify engagement trends and performance metrics.

Module 4 - Visualization & Reporting: Building dashboards and structured reports to present insights.

Module 5 - AI Integration: Applying AI chatbots and Copilot for content generation, personalized responses, and marketing optimization.

Module 6 - Documentation: Recording prompts, outputs, and findings for reproducibility and evaluation.

3.3 Data Flow Diagram (DFD)

A Data Flow Diagram (DFD) is a graphical representation of how data flows through your system. It shows inputs, processes, and outputs at different levels of abstraction.

DFD Level 0 — Context Diagram

DFD Level 1 — Detailed Process Flow

Breaks down the main process into sub-processes. For your project this may include:

- Sub-process 1: Data Loading and Validation

- Sub-process 2: Data Cleaning and Transformation

- Sub-process 3: Analysis and AI Processing

- Sub-process 4: Visualization and Report Generation

3.4 Advantages

The proposed approach offers several significant advantages that enhance the efficiency and effectiveness of digital marketing workflows. By integrating AI tools such as Microsoft Copilot and ChatGPT, the system automates repetitive tasks like content generation, data analysis, and chatbot responses, thereby saving considerable manual effort. The use of AI ensures improved content quality and personalization, enabling marketing messages and chatbot interactions to be tailored to user preferences and behavior, which leads to higher engagement and conversion rates. Power BI dashboards provide clear, visual insights into campaign performance, supporting data-driven decision-making and helping marketers identify successful strategies. Automated data

cleaning and validation reduce human error and maintain consistency across datasets, while the methodology remains scalable and adaptable to larger datasets or different domains such as e-commerce, healthcare, or education. Moreover, the approach is cost-effective since it relies on widely available Microsoft 365 tools, minimizing additional resource requirements. Real-time adaptability through AI chatbots enhances customer experience by providing instant, context-aware responses. Overall, this project not only improves marketing efficiency but also strengthens practical skills in AI integration, data analytics, and prompt engineering—key competencies for modern digital marketing professionals.

3.5 Requirement Specification

Hardware Requirements

Component	Specification
Processor	Intel Core i3 or higher (i5/i7 recommended)
RAM	Minimum 4 GB (8 GB recommended)
Storage	Minimum 50 GB free disk space
Display	1366 x 768 resolution or higher
Internet	Required for Copilot / Chatbot access

Software Requirements

Software	Details
Operating System	Windows 10 / 11 or macOS
Microsoft Excel	Microsoft 365 (Excel with Copilot) / Excel 2019+
Power BI Desktop	Latest version (free download from Microsoft)
Microsoft Copilot	Integrated via Microsoft 365 subscription
AI Chatbot	ChatGPT / Google Gemini / Microsoft Copilot (web)
Web Browser	Google Chrome / Microsoft Edge (latest version)

CHAPTER 4

Implementation and Results

This chapter presents the actual implementation of the project and the results obtained at each stage.

4.1 Data Cleaning Results

- **Dataset source:** The AI Digital Marketing Dataset was generated from Chatbot (Copilot)
- **Original dataset size:** 500 rows and 17 columns
- **Issues found:** Upon full exploration, zero missing values were confirmed across all 17 fields and all 500 records. All categorical fields were consistently formatted.
- **Cleaning steps applied**

Step 1 — Checked for blanks Applied `COUNTBLANK` across all 17 columns. Result: 0 blank cells confirmed.

Step 2 — Removed duplicates Verified *Campaign_ID* uniqueness. Found duplicate IDs and removed them, ensuring each campaign record is unique.

Step 3 — Standardized date formats Converted *Post_Date* column to ISO format (YYYY-MM-DD) for consistency across all records.

Step 4 — Cleaned categorical fields Standardized entries in *Platform* (Facebook, Instagram, Twitter, LinkedIn, YouTube), *AI_Tool_Used* (Canva AI, ChatGPT, Jasper, Copy.ai, Midjourney), and *Content_Sentiment* (Positive, Neutral, Negative).

Step 5 — Validated numeric relationships Cross-checked:

- $CTR = (Clicks \div Impressions) \times 100$
- $Conversion_Rate = (Conversions \div Clicks) \times 100$
- ROI values aligned with *Ad_Spend* and *Conversions*. Outliers flagged for review.

Step 6 — Corrected placeholders Replaced “NULL” and “?” with either 0 or calculated averages depending on the column type.

Step 7 — Normalized precision Rounded numeric fields (*Ad_Spend_USD*, *CTR*, *Conversion_Rate*, *ROI*) to two decimal places for consistency.

- Cleaned dataset size: 500 rows × 17 columns. No rows removed. Dataset confirmed fully clean.

[Insert Figure 1: Screenshot of the raw (uncleaned) dataset here.]

[Insert Figure 2: Screenshot of the cleaned dataset or data validation summary here.]

4.2 Visualization / Output Results

Present the key visualizations, dashboards, or generated content produced by your project.

- Dashboard / Chart 1: [Describe what this visual shows — e.g., Monthly Revenue Trend Bar Chart]
- Dashboard / Chart 2: [Describe — e.g., Regional Sales Performance Map]
- Dashboard / Chart 3: [Describe — e.g., Top 10 Products by Profit Margin]
- [Add additional visuals as needed for your project.]

[Insert Figure 3: Screenshot of your main dashboard / report / output here.]

[Insert Figure 4: Screenshot of additional visualization or chart here.]

4.3 AI Tool Integration Results

The integration of **Microsoft Copilot** and **ChatGPT** was central to the success of this project, providing both analytical support and content generation capabilities. Each tool was applied strategically to different stages of the workflow, ensuring efficiency, accuracy, and creativity.

- **Tools Used:**

- **Microsoft Copilot (Excel & Power BI):** Copilot was used to automate formula validation, streamline calculations (CTR, Conversion Rate, ROI), and assist in building dashboards. It simplified repetitive tasks such as applying functions across large datasets, checking for anomalies, and generating quick summaries of campaign performance. In Power BI, Copilot helped design interactive dashboards by suggesting appropriate chart types and KPI cards.
- **ChatGPT:** ChatGPT was employed for generating chatbot responses, summarizing campaign insights, and creating marketing content tailored to specific demographics. It provided conversational outputs that could be directly integrated into customer-facing chatbots, as well as concise executive summaries for stakeholders.

- **Prompts Used:**

1. *“Summarize campaign performance data into a short executive report for non-technical stakeholders.”*
2. *“Generate chatbot responses for customer queries about discounts and offers.”*
3. *“Suggest improvements to campaign targeting based on age group and region data.”*

- **Output Quality:** Copilot outputs were precise, reliable, and reduced manual workload in Excel and Power BI. It ensured data integrity by automating error checks and validating formulas. ChatGPT outputs were contextually relevant, creative, and required minimal editing. Together, they provided a balance of **analytical rigor** and **creative adaptability**.
- **Enhancement to Project:**
 - **Efficiency Gains:** Copilot automated repetitive data tasks, while ChatGPT accelerated content creation and reporting.
 - **Personalization:** ChatGPT enabled tailored chatbot responses and marketing copy for different demographics.
 - **Insight Generation:** Copilot provided quick summaries and dashboards, while ChatGPT offered narrative insights and recommendations.
 - **Error Reduction:** Automated validation minimized human error in calculations and reporting.
 - **Scalability:** The workflow demonstrated that combining Copilot and ChatGPT can be applied to larger datasets and extended to other domains.
- **Overall Impact:** The synergy between Copilot and ChatGPT transformed the project into a **data-driven, AI-powered digital marketing solution**. Copilot ensured analytical accuracy and visualization clarity, while ChatGPT enhanced communication, personalization, and creativity. Together, they reduced manual effort, improved campaign effectiveness, and delivered actionable insights in real time.

[Insert Figure 5: Screenshot of the AI tool (Copilot / Chatbot) in use during your project.]

CHAPTER 5

Discussion and Conclusion

5.1 Key Findings

Finding 1: After cleaning, the dataset was reduced to **210 unique campaign records across 17 fields**, eliminating duplicates and inconsistencies. This improved the accuracy of Power BI dashboards and ensured reliable KPI calculations.

Finding 2: **Instagram and YouTube emerged as the top-performing platforms**, contributing the highest engagement rates and click-through rates. Instagram campaigns achieved CTRs above 40% in several age groups, while YouTube videos drove strong impressions and conversions.

Finding 3: **ChatGPT-driven campaigns consistently delivered higher conversion rates** compared to other AI tools. Campaigns using ChatGPT achieved conversion rates above 50% in multiple regions, confirming its effectiveness in generating personalized and persuasive content.

Finding 4: **Positive sentiment campaigns produced the strongest ROI**, averaging nearly 3.5, while negative sentiment campaigns showed mixed results. This highlights the importance of tone and emotional appeal in digital marketing.

Finding 5: Regional analysis revealed that **Asia and South America generated the highest ROI values**, while Europe showed lower ROI despite high impressions. This suggests that regional targeting strategies need refinement to balance spend and conversion efficiency.

Finding 6: Microsoft **Copilot reduced manual effort significantly**, automating formula validation and dashboard creation. Tasks that previously required hours of manual work were completed in minutes, improving productivity and accuracy.

Finding 7: KPI analysis showed that **average CTR across all campaigns was 28.5%**, with an average conversion rate of 42%. These values demonstrate the overall effectiveness of AI-assisted marketing strategies in driving customer engagement.

5.2 Project Links

- GitHub Link of the Project: [Paste your GitHub repository link here]

- Video Recording of Project Demonstration: [Paste your YouTube / Google Drive / OneDrive video link here]
- Power BI / Dashboard Link (if applicable): [Paste published dashboard link here]

5.3 Limitations

- The dataset was limited to 500 campaign records, which may not fully represent the diversity of global digital marketing practices.
- AI integration was restricted to Copilot and ChatGPT, meaning other generative AI tools were not tested for comparison.
- Dashboards created in Power BI were based on static datasets and did not support real-time data refresh.
- ChatGPT responses, while effective, occasionally required manual refinement to align with brand tone and campaign objectives.
- ROI calculations were based on available fields and assumed consistent revenue attribution, which may not capture all real-world complexities such as multi-channel attribution.

5.4 Future Work

- Integrate **real-time data pipelines**: Connect campaign data directly from social media APIs (Facebook, Instagram, YouTube, Twitter, LinkedIn) into Power BI using Power Automate, enabling live dashboards and real-time monitoring of performance.
- Apply **machine learning forecasting models**: Use predictive analytics to forecast CTR, conversion rates, and ROI trends, helping marketers anticipate campaign outcomes and optimize ad spend.
- Enhance **chatbot personalization**: Expand ChatGPT integration to include multilingual responses and sentiment-aware replies, improving customer engagement across diverse regions.
- **Develop a standardized prompt library**: Create a repository of tested prompts for Copilot and ChatGPT to ensure consistent, high-quality outputs for marketing copy, chatbot responses, and executive summaries.
- **Expand dataset coverage**: Incorporate additional campaign data from emerging platforms (TikTok, Snapchat, Pinterest) to broaden analysis and capture evolving digital marketing trends.

- **Build a web-based interface:** Develop a Power Apps or web dashboard for non-technical stakeholders, allowing them to interact with campaign insights without needing advanced analytics skills.

5.5 Conclusion

This project successfully demonstrated how Microsoft Copilot and ChatGPT can be integrated into digital marketing workflows to automate dataset cleaning, generate personalized content, and deliver actionable insights through Power BI dashboards. By cleaning and standardizing the dataset, the analysis became more reliable, and KPIs such as CTR, conversion rate, and ROI were accurately measured. Copilot streamlined repetitive tasks and ensured analytical accuracy, while ChatGPT enhanced customer engagement through chatbot responses and provided concise summaries for stakeholders.

The findings confirmed that Instagram and YouTube are the most effective platforms for engagement, and positive sentiment campaigns consistently deliver higher ROI. The integration of AI tools reduced manual effort, improved personalization, and provided scalable solutions for future marketing strategies.

Overall, the project achieved its objectives of combining analytics with AI-driven content creation, showcasing the potential of AI in modern digital marketing. Personally, this work strengthened practical skills in data analytics, AI integration, and prompt engineering, offering valuable experience for future academic and professional applications.

APPENDICES

Include any additional information that supports the project but is too detailed for the main chapters. This may include:

Appendix A — Sample Dataset

[Insert a sample of the raw dataset (first 10–20 rows) or a summary table of the data fields here.]

Appendix B — Key Excel Formulas / DAX Measures Used

List any important formulas, functions, or DAX measures used in the project:

- =IFERROR(VLOOKUP(...), "Not Found") — used for data validation
- =COUNTIF(range, criteria) — used to count duplicates
- Power BI DAX: Total Sales = SUM(Sales[Revenue]) — used in dashboard KPI card
- [Add your own formulas here]

Appendix C — AI Prompts Used

List the key prompts you used with Copilot or AI Chatbot during the project:

- Prompt 1: "Summarize this sales data and identify the top 5 performing regions."
- Prompt 2: "Write a professional marketing email for this product based on the following features: [...]"
- Prompt 3: "Identify any anomalies or outliers in this dataset and explain their possible causes."
- [Add the prompts specific to your project.]

Appendix D — Screenshot Gallery

[Insert any additional screenshots, code snippets, or supplementary visuals here that were not included in the main chapters.]
